

Question 1: Explain the CSS box model and its components (content, padding, border, margin). How does each affect the size of an element?

➤ **CSS Box Model:**

- Describes how every HTML element is structured as a rectangular box.
- Determines how space and size are calculated around elements.

➤ **Components:**

→ **Content:**

- The actual text, image, or data inside the box.
- Size controlled by width and height.

→ **Padding:**

- Space between content and border.
- Increases the total element size.

→ **Border:**

- Surrounds the padding and content.
- Adds to the total width and height.

→ **Margin:**

- Space outside the border.
- Creates distance between elements (does not affect internal size).

➤ **Total Element Size = Content + Padding + Border + Margin**

Question 2: What is the difference between border-box and content-box box-sizing in CSS? Which is the default?

➤ **Difference between border-box and content-box in CSS**

- **box-sizing** defines how the total width and height of an element are calculated.

→ **1. content-box (Default):**

- Width and height apply **only to the content area**.
- Padding and border are **added outside**, increasing total size.

Total size = content + padding + border + margin

→ **2. border-box:**

- Width and height include **content, padding, and border**.
- Makes sizing easier and prevents layout shifts.

→ **Total size = width (includes content + padding + border) + margin**

➤ **Default:**

- **content-box** is the default box-sizing in CSS.
