

Question 1:

Explain the difference between web-safe fonts and custom web fonts. Why might you use a web-safe font over a custom font?

➤ **Web-Safe Fonts:**

- Fonts that are commonly installed on most devices and browsers.
 - Examples: Arial, Times New Roman, Verdana, Courier New.

→ **Advantages:**

- Load quickly; no extra files needed.
- Guaranteed to display correctly across devices.

→ **Disadvantages:**

- Limited variety; less unique design options.

➤ **Custom Web Fonts:**

- Fonts not commonly installed; loaded via `@font-face` or services like Google Fonts.

- Examples: Roboto, Lobster, Open Sans.

→ **Advantages:**

- Offers unique, attractive typography.
- Enhances website branding and design.

→ **Disadvantages:**

- Requires additional loading time.
- May not display if font file fails to load.

➤ **Why use Web-Safe Fonts:**

- For faster loading, better compatibility, and reliable display across all devices.

Question 2:

What is the font-family property in CSS? How do you apply a custom Google Font to a webpage?

- **Definition:** Specifies the typeface for text on a webpage.

- **Example:**

```
p {  
  font-family: Arial, sans-serif;  
}
```

- Uses Arial; if unavailable, defaults to any sans-serif font.

➤ **Applying a Custom Google Font:**

→ **Import the font in HTML <head>:**

```
<link href="https://fonts.googleapis.com/css2?family=Roboto&display=swap"  
      rel="stylesheet">
```

→ **Use font-family in CSS:**

```
body {  
  font-family: 'Roboto', sans-serif;  
}
```

- Ensures the webpage uses the custom Google Font with a fallback font.
